                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human inos or mimics.

Example 4; Page 36; 93pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (inoS) or mimics of this protein is used to the presence of human inoS protein in the sample. The method can be used for the detection and quantitation of human inoS in calls and tissues for various pathophysiclogical conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence in presence in page 2000.

Perection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.

Example 12; Page 53; 93pp; English.

Example 12; Page 53; 93pp; English.

Example 12; Page 53; 93pp; English.

Comparison describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human specific binding entity (e.g. a monoclonal antibody) reactive to human confidentiation in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psorlasis, and multiple sclerosis.                                                                                                                                                                                                            Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or minics.

Example 4; Page 36; 93pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detection of human inducible nitric oxide synthase - using an mannoassay in which a sample is contacted with a specific binding entity reactive with human iNoS or mimics.

Example 4; Fig 7B: 93pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (INOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock myocardial infarction, rejection of tissue in organs following such as lupus, psoriasis, and multiple sclerosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.

Example 12: Page 54; 93pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiclogical conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autolimune diseases such as lupus, psoriasis, and multiple sclerosis. Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.

Example 4: Page 36: 39pp: English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, sphock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNoS or mimics.

Example 4: Fig 7B: 93pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNoS) or mimics of this protein is used can be used for the detection and quantitation of human iNoS in cells and tissues for various pathophysiclogical conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence in prepresents a peptide from human inoS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    30-APR-1999 (first entry)

Human iNOS peptide fragment for epitope mapping #13.

Human iNOS peptide fragment for epitope mapping #13.

Inducible, nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis; epitope mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Example 12; Page 54; 93pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiclogical conditions such as sepsis, septic transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psortasis, and multiple sclerosis. This sequence in presence in page 100 multiple sclerosis. This sequence in presence in page 100 multiple sclerosis. This sequence in page 100 multiple is set in the method of the

Example 12: Page 73: 93pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (1NOS) or mimics of this protein is used can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiclogical conditions such as sepsis, septic shock myocardial infarction, rejection of tissue in organs following such as lupus, psortasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                                                                     30-APR-1999 (first entry)

Human iNOS peptide fragment PS-5236.

Human iNOS peptide fragment PS-5236.

Inducible, nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              30-APR-1999 (first entry)
Human iNOS peptide fragment PS-5269.
Human iNOS peptide fragment PS-5269.
Inducible, nitric oxide synthase; iNOS; human; immunoassay; detection; monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriaasis; autoimmune disease; multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               \overline{\mathrm{WPI}}; 98\text{-}594495/50. Detection of human inducible nitric oxide synthase - using an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DB 1; Leus

                                                                                                                   Detection of human inducible nitric oxide synthase - using an inducible nitric oxide synthase - using an entity reactive with human iNOS or mimics.

Example 4; Page 35; 93pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiclogical conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autolimune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence in persence in pumman iNOS which is used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection of human inducible nitric oxide synthase - using an entity reactive with human iNOS or mimics.

immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.

Example 12: Page 54: 39pp; English.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS portein in the sample. The method can be used for the detection and quantitation of human iNOS in calls and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriaals, and multiple sclerosis. Claim 8; Page 73; 84pp; English.

Claim 8: Page 73; 84pp; English.

The peptide (SEQ ID NO: 29) corresponds to residues 750-764 of CDIlb abount to 6 beta 2 integrin. The peptide may be synthesized or prepd. by recombinant techniques using the gene, the sequence of which was disclosed by Arnaout et al., J. Cell Biol. 106:213 (1988).

CReferences are also provided for the DNA sequences of human CDI8, CDIc and CDIa). The peptide is capable of inhibiting a CDIJ/CDI8

COLIC and CDIa). The peptide is capable of inhibiting a CDIJ/CDI8

CEPETURION injury, burns, frostbite, acute arthritis, asthma and adult respiratory distress syndrome. If may also be used to block intra-islet infiltration of macrophages associated with insulindependent diabetes mellitus, and for controlling phagocyte-media-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       09-APR-1997 (first entry)
Human beta2 integrin subunit CD11b, residues 750-764.
Beta2 integrin; A-domain; metal binding domain; inflammatory response; immune response; inhibition; phagocyte-mediated tissue injury;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 92-024197/03.

Beta-2 integrin peptide CD11b, recombinant hetero-dimer

CD11b/CD18 - or MAA against them; useful for inhibiting CD11/CD18

mediated immune response in control of phagocyte-mediated tissue
                                                10-APR-1992 (first entry)
Beta-2 integrin peptide derived from CD11b alpha subunit.
Beta-2 phagocyte-mediated tissue damage; A domain; MAM; inflammation; CD11/CD18 complex; alpha subunit; CR3; MO1; Mav-1; complement receptor type 3; heterodimer; collagen binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Arnaout MA;

WPI; 96-371376/37.

In vitro identification of integrin function antagonists - by measuring binding of A-domain peptide derived from integrin to ligand in presence and absence of candidate antagonist bisclosure; Page 11; 111pp; English.

The sequences given in W02037-80 represent peptides derived from beta2 integrin, esp. A-domain and the metal binding domains. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 23; DB 1; Length 15;

Example 5; Page 89; 262pp; English.

A non-dendritic peptide carrier (A) has been developed which is coupled through a linker to a solid phase, forming a complex of (A)-solid phase.

There (A) comprises 10-50 amino acids capable of forming a secondary structure in a benign buffer after liberation from the solid phase, and further the (A)-solid phase complex comprises an immunogenic substance and/or an immune mediator coupled on (A). The present sequence complex can be used as a scaffold for the production of represents a peptide used in an example from the present invention. An (A)-solid phase complex can be used as a scaffold for the production of chemical derivatives, characterised by covalently attaching molecules at attachment points. Alternatively (A) is used as a scaffold-peptide for the incorporation into an Immunostimulating complex (Iscom) resulting an (A)-Iscom complex which is used for the chemical coupling of antigenic substances in an aqueous solution by conjugation. (A) derivatised with one or more peptides having fibronectin., laminin. or vitronectin-like binding activities can be used for the promotion of call-attachment to plastic surfaces, in particular to inhibit tumour growth and metastasis, and for promotion of specifically-binding aptamers or as a diagnostic agent. Such diagnostic-(A) molecules could be used to detect molecules confidence in the selection of specifically-binding aptamers or as a diagnostic derived from or indicative of pregnancy or of a disease, such as an infectious, autoimmune or cancerous disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 7; Page 99; 262pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid encoding interleukin-1 receptor accessory protein - used for therapeutic modulation of IL-1 activity

Claim IT; Page 83; 95pp; English.

This peptide corresponds to amino acids 320-327 of novel human interleukin-1 receptor accessory molecule (ILI-R AcM) (see W53897),

a new member of the immunoglobulin superfamily that forms a complex with type 1 ILI-R. It comprises an epitope-bearing portion of ILI-R AcM. 18 Antigenic peptides comprising epitope-bearing portions of human IL-IR AcM are claimed (see W53898-915). These can be used to generate soluble IL-IR AcM-specific antibodies, and may be produced by chemical synthesis or by recombinant means using nucleic acid molecules (see V3859) of the invention. The ILI-R AcM, for affinity purification of ILI-R AcM and for identifying cells that express ILI-R AcM.
peptides were selected using the method of the invention which screens compounds for their ability to inhibit the binding of a selected integrin to a ligand which naturally binds to it. The method comprises measuring the binding of an A-domain peptide derived from the selected integrin, to the ligand in the presence and absence of the test compound and determining whether the binding is decreased. Identified compounds are capable of interfering with certain cellular immune/inflammatory responses, particularly phagocyte-mediated tissue injury and inflammation. The numbering of the amino acid residues is based on the the deduced amino acid sequence of the open reading frame of human CDIlb from Arnaout et al., J. Cell. Biol. 106:2153 (1988).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

further the (A)-solid phase complex comprises an immunogenic substance and/or an immune mediator coupled on (A). The present sequence represents a peptide used in an example from the present invention. An (A)-solid phase complex can be used as a scaffold for the production of chemical derivatives, characterised by covalently attaching molecules at attachment points. Alternatively (A) is used as a scaffold-peptide for the incorporation into an Immunostimulating Complex (Iscom) resulting an (A)-iscom complex which is used for the chemical coupling of antigenic substances in an aqueous solution by conjugation. (A) derivatised with one or more peptides having fibronectin-, laminin- or vitronectin-like binding activities can be used for the promotion of call-attachment to plastic suffaces, in particular to inhibit tumour growth and metastasis, and for promotion of yound healing. Also a derivatised (A) can be used for the selection of specifically-binding aptamers or as a diagnostic agent. Such diagnostic-(A) molecules could be used to detect molecules infectious, autoimmune or cancerous disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Protein fragment comparising neuro-active domain of ependymin enhances nerve connectivity and growth and is for treating nervous system disorders e.g. Huntington's, Parkinson's and Azbelmer's diseases

Claim 21; Page 53; 77pp; English.

The fragment is that of an active region of the ependymin neuroactive comain (gamma chain amino acids 164-169) effective in stimulating nerve factor manno acids 169:17; It can be used to treat nerve injuries and to correct genetic or systemic disorders, e.g. treatment of Huntington's, Parkinson's or Alzheimer's diseases, or to pretreat and to correct genetic or systemic disorders, e.g. treatment of Huntington's, Parkinson's or Alzheimer's diseases, or to pretreat correct before transplantation. It can be administered in sustained release form and may be coupled to a carrier which protects it against decomposition in the stomach and blood stream after oral subsequent release of the free fragment in the brain.

Sequence 6 AA;
                                                                                                                                                                                                                                                                                                        Transition of the companies antigen recognised by inflammatory of multiple sclerosis - comprises antigen recognised by inflammatory of the calls, and a fat emulsion carrier comprising e.g. soybean oil, egg phospholipid and glycerol solutions of the treatment of T cell mediated diseases or conditions, comprises a carrier, comprising 10-20% triglycerides and 1.2-2.4% phospholipids of plant and/or animal origin.

2.25-4.5% osmo-regulator, 0-0.05% antioxidant and sterile water of the treatment of the condition. The preparation can be used to treat insulin dependent diabetes or condition. The preparation can be used to treat insulin dependent diabetes or mellitus, when the antigen is a peptide derived from heat shock protein 60 (e.g. the present peptide). The emulsions promote a THI sequence 14 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Detecting transformed cells from expression of synaptonemal complex protein - for diagnosis, prevention and treatment of cancer.

Example 6, Page 10, 37pp; English.

This peptide corresponds to amino acids 41-50 of the previously cancer human synaptonemal complex protein 1 (SCP-1), a protein that is involved in meiosis and which is expressed in tumour cells, especially in renal cell carcinomas, gliomas and breast carcinomas, presumed to bind to MHC molecule Al. It is one of 83 peptides is presumed to bind to MHC molecule Al. It is one of 83 peptides (see W97901-83) derived from SCP-1 and identified as HIA binding motifs. Complexes formed between a peptide and an HLA molecule should provoke a cytolytic T cell response. The invention provides immunotherapeutic approaches to conditions characterised by aberrant or abnormal levels of one or more SCP proteins.
                    protein - for diagnosis, prevention and treatment of cancer Example 6; Page 12; 37pp; English.

This peptide corresponds to aniho acids 42-50 the previously known human synaptonemal complex protein 1 (SCP-1), a protein that is involved in meiosis and which is expressed in tumour cells, especially in renal cell carcinomas, gliomas and breast carcinomas, but not in healthy cells except for testis. The peptide is presumed to bind to MHC molecule 844. It is one of 83 peptides (see W97901-83) derived from SCP-1 and identified as HLA binding motifs. Complexes formed between a peptide and an HLA molecule should provoke a cytchytic T cell response. The invention provides immunotherapeutic approaches to conditions characterised by abberrant or abnormal levels of one or more SCP proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New pendymin peptide fragments - useful for promoting nerve growth Claim 1; Column 23; 19pp; English.

Claim 1; Column 23; 19pp; English.

Claim 1; Column 23; 19pp; English.

Depresent fragments of the nerve growth factor ependymin. Ependymin is a glycoprotein dimer. The protein is synthesised by specific cells which secrete and maintain a steady state concentration of the protein in the extracellular and cerebrospinal fluids of the brain. Ependymin is a nerve growth promoter, but it is not currently known how it functions. These sequences promote nerve growth, and may be used as therapy to enhance recovery after stroke, to counteract age-related mannory loss, or to treat neurodegenerative diseases. These sequences can also be used for research purposes, such as in neuron transplantation studies. Patty acid conjugates of these peptides (using 16-22C fatty acids) have an increased brain-penetration index, and may be used for the
                                                                                                                                                                                                                                                                                                                                        09-DEC-1996 (first entry)

Ependymin peptide fragment #8.

Recombinant DNA encoding allergens of Alternaria alternata - useful
The diagnosis and treatment of A. alternata allergies
Claim 1: Page 11: 21pp: German.

R88681-91 are T-cell epitopes derived from the Alt a 45 allergen protein
R88681-91 are T-cell epitopes derived from the Alt a 45 allergen protein
C (R88672) isolated from Alternaria alternata. Peptide epitopes from Alt a
45 and Alt a 12 (R88662) are useful as diagnostic reagents, e.g. for in
viro detection of allergy caused by Alt a 45 and 12 (by reaction with
C igf in serum). They can also detect collular reaction to the specified
allergens (from their stimulatory or inhibitory effect on this reaction).
The peptides can also be used therapeutically to induce immunotolerance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Imminosuppressive polypeptide analogues of apolipoprotein E - for modulating lymphocyte proliferation and ovarian androgen synthesis, e.g. for treating inflammation, polycystic ovaries, hypercholesterolaemia, and in diagnosis Example 1; Page 59; 118pp; English.

This sequence was synthesised together with R25220-6 and a rhis sequence was synthesised together with R25220-6 and a lymphocyte cell culture system to examine the ability of apoE to inhibit lymphocyte differentiation as evidence by proliferation. It was found that they had no effect on lymphocyte proliferation when used in nonconjugated monomeric form. However, when these peptides were used conjugated to bovine serum albumin (BSA) lymphocyte proliferation was inhibited in an equivalent manner by call peptides studied as evidenced by decreasing amounts of thinde uptake with increasing dose of conjugate. See also R25211-26.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                      Detection of human inducible nitric oxide synthase - using an inducible nitric oxide synthase - using an entity reactive with human iNOS or mimics.

Example 4; Page 34; 93pp; Bnglish.

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiclogical conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple scherosis. This sequence

N.Alternate names: thylakoid membrane protein
N.Alternate names: thylakoid membrane protein
S.Species: Nicotiana tabacum (common tobacco)
C.Date: 31-Dec-1993 #sequence_revision 31-Dec-1993 #text_change 17-Mar-1999
C.Accession: A61002
R.Bauw, G.; Rasmussen, H.H.; Van Den Bulcke, M.; Van Damme, J.; Puype, M.; Gesser, B.; C
Electrophoresis 11, 528-536, 1990
A.Title: Two-dimensional gel electrophoresis, protein electroblotting and microsequencin
A.Reference number: A61002; MuD:91031404
A.Accession: A61002
A.Molecule type: protein
A.Residues: 1-14 CBAU>
C.Keywords: chloroplast; membrane protein; photosynthesis; photosystem II; thylakoid
